PROTOTYPE VENTURE CONCEPT

Make existing stock work harder.

Decision intelligence for B2B distributors.

Spot misplaced inventory. Compare the economics.
Keep every decision in human hands.

Stock can be plentiful. Availability can still fail.

The planner needs a decision—not another disconnected spreadsheet.

01

Demand gets hidden

Stockout zeros and missing sales rows can make an active market look quiet.

02

Capital sits idle

One location carries ageing stock while another cannot meet demand.

03

The cure can cost more

A rushed transfer may arrive late—or consume more margin than it saves.

Start with one urgent buyer.

Proposed beachhead: multi-location UAE B2B electronics distributors.

THE BUYER

Head of operations or inventory planning

Owns availability, working capital and inter-warehouse decisions.

LAND

A single distributor network

Use familiar CSV exports; prove one repeatable planning workflow.

EXPAND

More locations and product lines

Reuse mappings and decision history once value is demonstrated.

VALIDATE

Size the reachable market bottom-up

Qualified accounts × validated annual price. No TAM claim yet.

One workspace. Seven steps to a defensible plan.

Working Streamlit interface with deterministic calculations and optional tool-grounded chat.

01 / UNDERSTAND

Stock overview

Available, reserved, inbound + sources

Forecast

P10 / P50 / P90 demand + data quality

02 / DECIDE

Imbalances

Shortage, excess and ageing exceptions

Recommendations

Feasible quantities, routes and economics

Impact

Before / after outcomes on one forecast

03 / CONTROL

Edit records

Correct once; recompute the whole plan

Assistant

Explain evidence; stage changes for review

Human review required. No stock movement executes.

The right stock exists. It is in the wrong place.

SKU01 charger | Current prototype snapshot: 26 October 2026 | Forecast: next 30 days

DUBAI

500 available units

P50 demand 191.50

P10 175.46 / P90 207.54

ABU DHABI

100 available units

P50 demand 353.06

P10 334.21 / P90 371.90

SHARJAH

300 available units

P50 demand 159.75

P10 147.50 / P90 172.00

234 units → **Dubai to Abu Dhabi** 2-day lead | AED 171.80 transfer cost

Source: current seed-42 pipeline. Synthetic data; fitted forecasts are uncertain, not customer demand commitments.

A measurable case for better allocation.

Synthetic 30-day simulation | Same cleaned forecast, before and after all proposed transfers

PROJECTED SHORTAGE UNITS

Same network. Same demand model. Different allocation.

78.7%

fewer projected shortage units

AED 5,911.64

Net benefit after transfer costs

MODELLED, NOT REALISED

Source: eval_report.md, normal-plan impact. Proposals are not executed; these are modeled estimates, not realised savings.

Designed to say “no” when the economics do.

The product is an accountable decision layer—not an autonomous stock-moving agent.

REJECTED / LOW-MARGIN TRANSFER

AED 19.06 expected benefit

AED 231.80 transfer cost

Net: AED −212.74. Reject transfer.

1 **Scoped events**

Only listed products and matching inbound routes are affected.

2 **Traceable calculations**

Source rows, timestamps, assumptions and cost breakdowns.

3 **Explicit human approval**

A dated intent log. No purchasing or stock movement executes.

Sell the decision workflow. Price the network.

Proposed commercial model—not current revenue, signed contracts or validated pricing.

01

Paid pilot

Fixed-scope onboarding, baseline measurement and a planner-reviewed trial.

02

Annual subscription

Platform fee with location or SKU-volume tiers. Price to be tested with buyers.

03

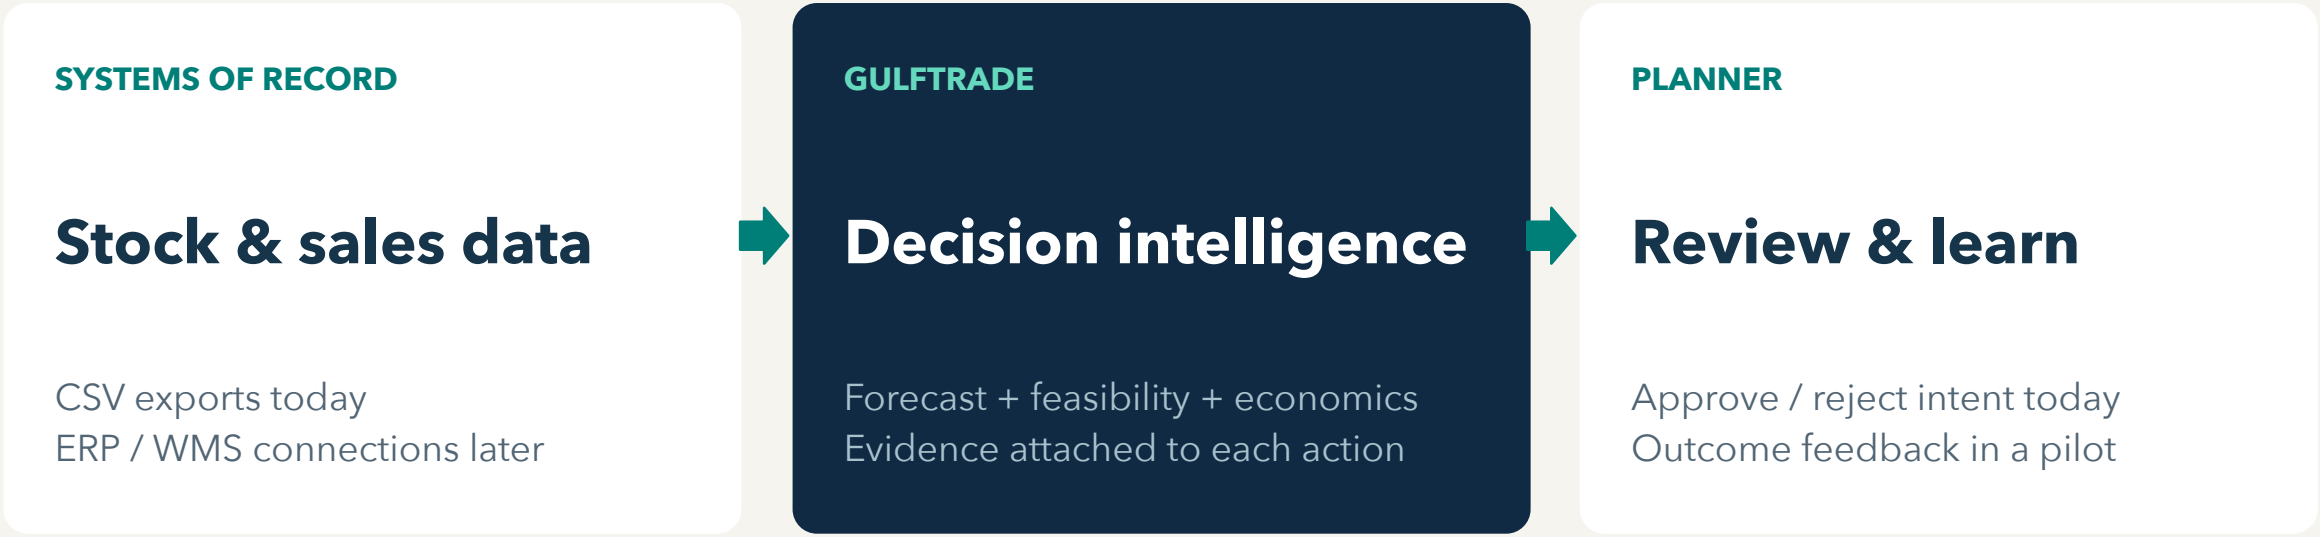

Integration services

ERP/WMS mapping and connectors, priced separately.

Commercial gate: validate willingness to pay and delivery cost before forecasting ARR or margin.

Add decision intelligence. Keep the ERP.

Compete for the planner's daily decision workflow before expanding the product surface.

Potential defensibility: reusable data mappings, operational constraints and measured decision outcomes.

Prove a paid deployment. Then scale.

Founder-led distribution discovery, followed by a tightly measured pilot.

01

Recruit design partners

Target three qualified distributor teams. Confirm data access and a named planner owner.

02

Run in shadow mode

Record current decisions and measure recommendations without executing movements.

03

Convert on evidence

Offer paid deployment only after buyer-agreed value and adoption gates are met.

TARGETS, NOT SIGNED PARTNERS. NO CUSTOMER TRACTION IS CLAIMED.

De-risk data, trust and value—in that order.

Milestone sequence begins after partner access, staffing and scope are agreed.

DAYS 01-30

Reliable inputs

Map sources. Reconcile inventory. Establish the baseline and permissions.

Gate: trusted source data

DAYS 31-60

Safe decisions

Add capacity and transport constraints.
Calibrate forecasts in shadow mode.

Gate: feasible, reviewable plans

DAYS 61-90

Measured value

Track actual decisions and outcomes. Test adoption, pricing and delivery cost.

Gate: paid-deployment decision

Back a disciplined path from prototype to paid pilot.

The next milestone is commercial proof–not more demo features.

CAPITAL FOR

Trusted data, a safer product and a measured pilot.

INTRODUCTIONS TO

Design partners and operators who own inventory decisions.

TERMS TO DEFINE

Raise size, valuation and runway after the pilot budget is agreed.

Working software. Transparent evidence.

Engineering evidence is not customer traction, and one synthetic backtest is not validation at scale.

49 / 49

automated tests passed

30 / 30

planted-case checks passed

30-day total WAPE

14.48% model / 15.16% baseline

A small aggregate improvement on this split.

Daily-demand WAPE

62.37% model / 60.00% baseline

The model does not beat the daily baseline.

P10–P90 coverage

56.67% observed / 80% nominal

Intervals need calibration before a real pilot.

Sources: eval_report.md; pytest run in the project virtual environment (49 passed, 27 October 2026).

Evidence today. Hypotheses to validate.

A clean boundary between a working case study and an investable operating business.

PRODUCT	Seven tabs, source traceability, human review	app.py; agent/; engine/
DATA	20 SKUs, 3 locations, 5,000 available units; synthetic	data/README.md; make_data.py
VALUE	Modeled before/after impact; no realised savings	eval_report.md; simulation.py
COMMERCIAL	Pricing, customers, market size and moat unvalidated	Proposed strategy in this deck
FUNDRAISING	Team credentials, raise size and terms not provided	Founders to define before raising

Use the final two slides for Q&A. The main pitch is slides 1–12; detailed sources are in speaker notes.
